1. Product knowledge & recipient experience

These notes support partner macros and FAQ pages for the Ghana payout product (tGHS treasury !' MoMo / bank).

What the product does

Your institution converts USDT/USDC to GHS on the Transika OTC desk, holds a managed tGHS balance (a GHS claim with Transika), then pays Ghana mobile money or bank beneficiaries via the dashboard or API.

Recipient experience

- MoMo: MTN Mobile Money, Telecel Cash, AirtelTigo Money. The recipient is credited on their wallet and typically receives a network SMS/push from the telco (not from Transika).
- Bank: Major Ghana banks on our payout catalog (e.g. GCB, Ecobank, Stanbic, Absa, Fidelity, Zenith, Access, and others). Credit appears via the beneficiary's bank statement/notification.
- Before payout we support name enquiry so the registered holder name can be confirmed and stored.
- End-user status on your side should follow our payout lifecycle: approved !' burn !' payout_pending !' completed or payout_failed, plus webhooks / polling by your reference.

What recipients do not see

Recipients do not interact with Transika, tGHS, or crypto. They only receive GHS on MoMo or bank.

2. Performance nuances

Days when transfers may not complete promptly, and which routes are instant versus non-instant.

Route	Typical speed	Delay / non-delivery windows
MoMo (MTN / Telecel / AirtelTigo)	Near-instant (seconds–minutes) when the telco and rail are healthy	Telco maintenance, network outages, invalid/unregistered numbers, or wallet limits can leave a transfer pending or failed
Bank (Ghana Send-to-Bank)	Usually same-session / near-real-time on supported banks when the bank rail is up	More sensitive to bank processing windows, weekends, and Ghana public holidays; some bank credits can sit pending longer than MoMo

Operational framing for FAQs

- Treat MoMo as instant / near-instant; treat bank as near-instant with higher pending risk outside banking hours.
- We do not batch payouts to “next business day” by design; each payout is submitted when you request it. Pending reflects rail/bank/telco behaviour, not a scheduled hold.
- There is no hard “do not deliver on X day” calendar on our product. Practical delays cluster around telco downtime, bank holidays/weekends, and rail incidents.
- Always use status / webhooks: payout_pending is not paid; only completed means the beneficiary was paid.

If you need contractual maximum times, numeric SLAs can be attached in the commercial schedule.

3. Escalation matrix / POD access / portal

Preferred path (reduces escalations)

Use the Transika merchant dashboard and/or merchant API:

- Look up by your reference or our redemption id: receipt status, amount, beneficiary snapshot, timestamps, and on-chain burn proof (burnExplorerUrl / burnTxHash).
- Period statements (CSV / Excel / PDF) for ledger evidence.

Access requirements

KYB-approved merchant account, Live enabled, and dashboard users and/or API keys (api:read / api:write). Additional CS users can be provisioned on your merchant organisation if needed.

Escalation when self-serve is not enough

For example US error assertions needing rail-level POD.

- Email: support@tran-sika.com
- Include: your transaction id / reference, Transika redemption id (if known), amount, currency, beneficiary (masked OK), date/time (UTC), and reason (POD / failed / stuck pending / US customer dispute).

We do not currently expose a separate rail partner portal for CSPartner direct POD download. Rail confirmations for disputes are fulfilled by Transika ops from our receipt and provider records.

4. Reversals — process & review criteria

A successful Ghana credit (status completed) is not auto-reversible via API. “Reversal” on our ledger means restoring tGHS after a failed payout, not clawing back money already in a recipient wallet.

Situation	Process
Payout failed after burn (payout_failed)	Ops may retry the same payout on the rail, or reissue tGHS to your balance (statement line: Reversal) so you can pay again. Reissue eligibility typically waits a short failed-age window (default 24 hours unless waived).
Stuck payout_pending	Escalate; we reconcile with the rail (callback / status check) and close to completed or failed.
Completed but customer claims not paid	Escalate with ids (especially US). We investigate against rail confirmation / external txn id and share POD. True bank/MoMo clawback is exceptional and case-by-case with evidence — not a self-serve product.
Customer wants money back after successful delivery	Not a Transika reversal product; treat under your refund policy / new collection. We will not reverse successful credits without a documented error case.

Happy to review

- Failed or stuck payouts
- Mismatches (wrong amount/status)
- All US customer error assertions
- POD requests tied to a concrete transaction id

Not appropriate escalations

- Requests to edit or reverse a confirmed successful payout without an asserted error
- Speculative “please reverse just in case”
- Amount/beneficiary changes after submission (see transfer edits)

We acknowledge you will always escalate US customer errors; that is expected and supported.

5. Transfer edits

No. Submitted payouts cannot be edited (amount, beneficiary, account, or network).

- Correct path: wait for terminal status. If failed !' retry or reissue + new payout with correct details. If completed incorrectly !' escalate as an error case (US or otherwise); do not attempt an edit.
- Saved beneficiaries: rail fields (account number, network, name) are immutable after create; only label / your reference id can change. Wrong account !' create a new beneficiary.

6. POP / POD without a rail portal

Evidence	How you obtain it
Business receipt / status	Merchant dashboard redemption page or GET /tghs/redemptions/{id reference} — status, amount, beneficiary, timestamps, your reference
On-chain proof of redemption (burn)	burnExplorerUrl / burnTxHash on the receipt
Ledger / statement proof	Statements export (PDF / CSV / Excel)
Rail-level POD (telco/bank external txn confirmation) for US disputes	Escalate to support@tran-sika.com with your reference + Transika id; we supply confirmation from ops records

For US customers asserting an error, escalate early with ids; we treat POD fulfilment as a compliance-supporting ops workflow.

7. Closing

We are happy to join a short call to align SLAs, CS user access, and the exact escalation mailbox for your CSPartner portal.
